KNF 121308-121311 07/18
Translation of original Operating Instructions, english
Items including delivery:

- Vacuum pump system including hand terminal (batteries included)
- Coated collection flasks (2 x)
- Flask clamps (2 x)
- Mains cable
- USB cable for connecting vacuum pump system to PC
- Power supply for hand terminal
- Operating Instructions
- Abbreviated instructions
- CD with digital Operating Instructions and software for operating the vacuum pump system with a PC
- Allen key for transport fastener

Transport fastener

The hand terminal is fastened in place at the factory, to prevent damage during transport.

To remove the hand terminal, it is first necessary to release the transport fastener. For further details, see chapter 6. Installation and connection.

Translation of original Operating Instructions, english, KNF 121308-121311 07/18
1. About this document

1.1. Using the Operating Instructions

The Operating Instructions are part of the vacuum pump system.

→ Carefully study the Operating Instructions before using a vacuum pump system.

→ Always keep the Operating Instructions handy in the work area.

→ Pass on the Operating Instructions to the next owner.

Project systems

Customer-specific project systems (systems which begin with “PJ” or “PM”) may differ from the Operating Instructions.

→ For project systems, also observe the agreed upon specifications.

<i>Compliance with the Operating Instructions is essential for the safe and reliable operation of the vacuum pump system. Failure to do so may result in damage or injury.</i>

1.2. Symbols and Markings

<i>Warning</i>

A danger warning is located here.

Possible consequences of a failure to observe the warning are specified here. The signal word, e.g. Warning, indicates the danger level.

→ Measures for avoiding the danger and its consequences are specified here.

<i>Danger levels</i>

<table>
<thead>

<td>Death or serious injuries and/or serious damage are possible.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>warns of a possibly dangerous situation</td>
<td>Minor injuries or damage are possible.</td>
</tr>
</tbody>
</table>

<i>Tab. 1</i>

<i>Other information and symbols</i>

→ An activity to be carried out (a step) is specified here.

1. The first step of an activity to be carried out is specified here.

Additional, consecutively numbered steps follow.

<i>This symbol refers to important information.</i>
2. Use

2.1. Proper Use

The SC 920G vacuum pump system is designed for use in chemical, pharmaceutical, and biological laboratories. The vacuum pump system is exclusively intended for transferring gases and vapors.

Make sure that the installation location is dry and the pump/system is protected against rain, splash, hose and drip water.

Vacuum pump system is solely for use in indoor areas.

Owner's responsibility

Operating parameters and conditions

Only install and operate the vacuum pump system under the operating parameters and conditions described in chapter 4, Technical data.

Protect vacuum pump system against humidity.

Requirements for transferred medium

Before using a medium, check the compatibility of the materials of the pump head, diaphragm, valves, sealings and tubing with the medium.

Before using a medium, check whether the medium can be transferred danger-free in the specific application case.

Only transfer gases which remain stable under the pressures and temperatures occurring in the pump.

High performance condenser

The high performance condenser must be installed on the outlet side of the pump; if it is installed on the inlet side there is a danger of implosion.

Observe the correct usage of the gas- and cooling liquid-connections on the high performance condenser. Inlet and outlet connections for the gas are not interchangeable.

Accessories

Laboratory equipment or additional components connected to a vacuum pump system have to be suitable for use with the pneumatic capabilities of the vacuum pump system (see chapter 4, page 8).

2.2. Improper Use

The vacuum pump system may not be operated in an explosive atmosphere.

The vacuum pump system is not suitable for transferring dusts.

The vacuum pump system is not suitable for transferring liquids.

The vacuum pump system must not be used if the entry of air or gas into the vacuum pump system during venting (vent valve) could result in the creation of reactive, explosive or otherwise hazardous mixtures (e.g. with the medium).

The vacuum pump system must not be used to create vacuum and overpressure simultaneously.

An overpressure must not be applied to the suction side of the vacuum pump system.
3. Safety

The vacuum pump system is built according to the generally recognized rules of technology and in accordance with the occupational safety and accident prevention regulations. Nevertheless, dangers can result during their use which lead to injuries to the user or others, or to damage to the vacuum pump system or other property.

Only use the vacuum pump system when it is in a good technical and proper working order, in accordance with its intended use, observing the safety advice within the operating instructions, at all times.

Make sure that only trained and instructed personnel or specially trained personnel work on the vacuum pump system. This especially applies to assembly, connection and servicing work.

Make sure that the personnel has read and understood the operating instructions, and in particular the "Safety" chapter.

Observe the accident prevention and safety regulations when performing any work on the vacuum pump system and during operation.

Do not expose any part of your body to the vacuum.

Open housing parts with notice sticker (see fig. 1) only after separating mains plug from power source.

Ensure that the employees check that the hand terminal is the right one for this particular system before using a SC 920G vacuum pump system. Vacuum pump systems are equipped with a paging system for this purpose (see Actuating the vacuum pump system, page 29).

When transferring dangerous media, observe the safety regulations when handling these media.

Be aware that the vacuum pump system is not designed to be explosion-proof.

Make sure the temperature of the medium is always sufficiently below the ignition temperature of the medium, to avoid ignition or explosion. This also applies for unusual operational situations.

Note that the temperature of the medium increases when the pump compresses the medium.

Hence, make sure the temperature of the medium is sufficiently below the ignition temperature of the medium, even when it is compressed to the maximum permissible operating pressure of the vacuum pump system. The maximum permissible operating pressure of the vacuum pump system is stated in the technical specifications (see chapter 4, page 8).

If necessary, consider any external sources of energy, such as radiation, that may add heat to the medium.

In case of doubt, consult the KNF customer service.
<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ventilating the vacuum pump system</td>
<td>When ventilating the vacuum pump system with air or inert gas, be sure to prevent formation of reactive or explosive media. The maximum permissible operating pressure at the ventilation connection (Fig 2/5, page 11) is 0.1 bar g.</td>
</tr>
<tr>
<td>Environmental protection</td>
<td>Store all replacement parts in a protected manner and dispose of them properly in accordance with the applicable environmental protection regulations. Observe the respective national and international regulations. This especially applies to parts contaminated with toxic substances.</td>
</tr>
</tbody>
</table>
| Standards                    | The vacuum pump system SC 920G conforms to the Directive 2011/65/EU (RoHS2). The vacuum pump system SC 920G conforms to the safety regulations of the EC Directive 2014/30/EU concerning Electromagnetic Compatibility and the EC Directive 2006/42/EC concerning Machinery. The requirements of the following harmonised standards are fulfilled:  
  - DIN EN 61010-1  
  - DIN EN 61326-1 – class A  
  - DIN EN 50581  
  The pumps correspond to DIN EN 60664-1:  
  - the overvoltage category II  
  - the pollution degree 2 |
| Customer service and repairs  | Only have repairs to the vacuum pump system carried out by the KNF Customer Service responsible. Only authorized personnel should open those parts of the housing that contain live electrical parts. Use only genuine parts from KNF for servicing work. |

</table>

* Applies to standard included batteries

- When charging the hand terminals of the SC 920G vacuum pump system, use only the original power supply from KNF.
- Several different vacuum pump systems may be operated simultaneously with their respective hand terminals within the wireless connection range.
- The wireless connection between hand terminal and vacuum pump system is robustly resistant to operation of mobile telephones and Bluetooth devices in the immediate area.

4.3. Software

The USB connection between the PC and the vacuum pump system is operated as an RS232 interface. Accordingly, in the operating system it is managed as an additional COM connection and can be addressed with conventional terminal software. Please see the delivered CD for information on operating the vacuum pump system via software.
5. Design and Function

19. Coolant connection on high-performance condenser (feed)
20. Coolant connection on high-performance condenser (return)

Fig. 2: Vacuum pump system SC 920G
The vacuum pump system generates a vacuum that can be controlled either through the hand terminal (see chapter 5.3, page 15) or a PC.

Collection flask (Fig. 2/12) collects on the suction side of the pump particles and drops that were, contrary to the requirements of the pump, suctioned from the vacuum chamber. The collection flask is coated (implosion protection) and fastened to the vacuum pump system via a flask clip.

The high-performance condenser at the pump outlet once again recollects solvents from the pumped gas instead of allowing it exit into the environment or fume hood. The high-performance condenser is surrounded by a shell for temperature insulation and explosion protection.

Solvents deposited in the high-performance condenser are collected in the coated (for explosion protection) collection flask (Fig. 2/15). A flask clip secures the glass flask to the condenser flange. A recirculating cooler or continuously flowing cold water cools the high-performance condenser to the condensation temperature.
5.2. Vacuum pump system functions

The vacuum pump system can be operated in four different modes:

- **Evacuate**
  The vacuum pump system evacuates a vacuum chamber with adjustable pump capacity.

- **Pressure control**
  The vacuum pump system controls system pressure to the set-point pressure value (constant pressure).

- **Automatic**
  The vacuum pump system independently finds the sample's vapor pressure and adjusts process pressure accordingly.

- **Function**
  The vacuum pump system controls pressure according to the entered pressure curve. Up to 10 different pressure curves can be stored. The following process parameters can be entered:
    - Setpoint pressure at various time points after starting the process
    - Coolant valve (accessory) ON and OFF with time point after start of process
    - Option "Jump" with time after the start of the process:
      The system evacuates/ventilates to the required pressure as quickly as possible.
    - Option "Automatic" with time after the start of the process:
      Automatic detection of the boiling pressure
      If the set limit pressure is reached without a vapor pressure, the program goes to the next function step.
    - Option "Automatic Plus" with time after the start of the process:
      Automatic detection of the vapor pressure with subsequent pressure reduction.

At any time during an active process, you can switch to manual process control. Functions for Evacuate and Pressure control will be available simultaneously. When activating manual process control, the current actual pressure will be adopted as the first setpoint pressure. In other words, process pressure will be initially "frozen" at the current value.

The operating modes can be combined in any way for the purposes of intelligent process control. For example, after successful boiling point detection in the automatic mode, the following operating modes are available for specific distilling off of the solvent recovered:

- **Evacuation**
  (constant vaporization rate for optimum condenser capacity utilization)

- **Function**
  (Following a preset pressure ramp provided in order to attain a separation from components with higher boiling points)
- Manual process control
  (active control of the distillation using the setpoint pressure)

In order to change to another operating mode, the process is first stopped and then restarted in the new operating mode.

Gas ballast

The gas ballast switch (Fig. 2/5) can be used to open and close the gas ballast valve on the vacuum pump system's pump (see Chapter 5.5).
5.3. Hand terminal

Basic elements

1. Upper grip  
2. Touchscreen  
3. I/O switch  
4. DC input 24 V  
5. Rotary/push knob for  
   - adjusting pump speed and setpoint pressure  
   - switching to manual operation

Function

The hand terminal is used to set process parameters with which the vacuum pump system will control pressure.

Settings can be made on the hand terminal's touchscreen (2) and with the rotary/push knob (5).

To operate the vacuum pump system remotely, remove the hand terminal from the holder (see chapter 8.1.1, page 23) on the vacuum pump system. This provides a convenient way to operate the vacuum pump system when it is in a cabinet or under a closed fume hood.

Whenever the hand terminal is located in the holder while the vacuum pump system is turned on, the batteries in the hand terminal will charge automatically. This happens even when hand terminal is switched off. Alternatively, the batteries can be charged through the hand terminal's power supply (see DC input (4)). As a result, it is not necessary to place the vacuum pump system where it is easily accessible for the user.

The power supply also makes it possible to supply the hand terminal with electrical power directly from a mains connection.

An acoustic alarm sounds on the hand terminal when the battery charge levels are low.
5.4. Pump

**Design**

| 1 | Outlet valve |
| 2 | Inlet valve |
| 3 | Transfer chamber |
| 4 | Diaphragm |
| 5 | Eccentric |
| 6 | Connecting rod |
| 7 | Pump drive |

![Fig. 5: Pump design](image)

**Function Diaphragm pump**

Diaphragm pumps transfer, compress (depending on pump version) and evacuate gases and vapors.

The elastic diaphragm (4) is moved up and down by the eccentric (5) and the connecting rod (6). In the downward stroke it aspirates the gas to be transferred via the inlet valve (2). In the upward stroke, the diaphragm presses the medium out of the pump head via the outlet valve (1). The transfer chamber (3) is hermetically separated from the pump drive (7) by the diaphragm.

5.5. Gas ballast

**WARNING**

Personal injury caused by poisoning or explosion and damage to the pump

Make sure that no reactive or explosive mixtures will be produced when the gas ballast valve is open.

When transferring vaporous media, opening the gas ballast valve can minimize the formation of condensation in the pump heads.

Opening the gas ballast valve deteriorates ultimate vacuum performance.

The gas ballast valve is opened and closed via the gas ballast switch (see Fig. 6).

Please contact KNF Service if you require an inert connection for the gas ballast.
6. Installation and connection

- Only install the vacuum pump system under the operating parameters and conditions described in chapter 4, Technical data, page 8).
- Observe the safety precautions (see chapter 3, page 6).

6.1. Installation

- Before installation, store the vacuum pump system at the installation location to bring it up to room temperature.
- Make sure that the installation location is dry and the vacuum pump system is protected against rain, splash, hose and drip water.
- Choose a safe location (flat surface) for the vacuum pump system.
- Protect the vacuum pump system from dust.
- Protect the vacuum pump system from vibrations and jolts.
- Only connect components to the vacuum pump system which are designed for the pneumatic data of the vacuum pump system (see chapter 4, page 8).
- A recirculating cooler or flowing cold water (or another cooling medium) is needed to cool the high-performance condenser to the condensation temperature.

1. Loosen the set screw (Fig. 2/3, p. 11).
2. Pull out the pin of the transport fastener (Fig. 2/18, p. 11) as far as the limit stop.
3. Tighten the set screw again.

The transport fastener can be reattached for any future transport operations.
6.2. Connection

1. Connect the vacuum chamber to the gas inlet's hose connector (Fig. 2/7, page 11, for hose inside diameter of 10 mm). For this, vacuum tubing must be used.

2. Connect hose to high-performance condenser in order to discharge gas exhaust (Fig. 2/17, page 11).

---

**CAUTION**

Danger of high performance condenser bursting. The high-performance condenser is not pressure-proof.

**CAUTION**

Do not reduce or regulate the quantity of gas at the gas outlet, and do not install any components that hinder the gas flow.

---

3. Safely discharge gas exhaust so that no gas can escape into the ambient air.

4. Make sure that the high-performance condenser's gas outlet is not blocked (high-performance condenser is not pressure-proof).

3. Attach coolant feed and return to high-performance condenser (Fig. 2/19 and 20, page 11).

3. Connect only the KNF coolant valve (see Chapter 11.2, Accessories) to the coolant valve connection (Fig. 3/2, page 12). Consult with KNF before using any other valves.

4. If necessary: Connect inert gas supply to ventilation connection (Fig. 2/6, page 11). Observe the safety instructions in chapter 3.

5. Insert the power cable plug into a properly installed shockproof socket.
7. Operation

7.1. Start up

Before switching on the vacuum pump system, observe the following points:

<table>
<thead>
<tr>
<th>Operational requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>▪ All hoses attached properly</td>
</tr>
<tr>
<td>▪ Fan openings not blocked</td>
</tr>
<tr>
<td>▪ Specifications of the power supply correspond with the data on the vacuum pump system’s type plate.</td>
</tr>
<tr>
<td>▪ Recirculating cooler or cold water connection ready on high-performance condenser.</td>
</tr>
<tr>
<td>▪ The high-performance condenser’s gas outlet is not blocked (high-performance condenser is not pressure-proof).</td>
</tr>
<tr>
<td>▪ Vacuum pump system is at room temperature.</td>
</tr>
<tr>
<td>▪ Vacuum pump system and hand terminal belong together.</td>
</tr>
<tr>
<td>▪ No reactive, explosive or otherwise hazardous mixtures may be produced when ventilating the vacuum system through the air inlet (Fig. 2/6, page 11) (if necessary, use an inert gas)</td>
</tr>
<tr>
<td>▪ When the gas ballast valve is open, no reactive, explosive, or otherwise hazardous mixtures can form (otherwise, contact KNF Service).</td>
</tr>
</tbody>
</table>

Tab. 4

- Only operate the vacuum pump system under the operating parameters and conditions described in chapter 4, Technical data (page 8).
- Make sure the vacuum pump system is used properly (see chapter 2.1, page 5).
- Make sure the vacuum pump system is not used improperly (see chapter 2.2, page 5).
- Observe the safety precautions (see chapter 3, page 6).
DANGER
Uncontrolled operation may result in personal injury and damage to the vacuum pump system.

When using several vacuum pump systems, there is the danger of confusing them, which can result in undesired interference into other processes: The transmission of commands from the wrong hand terminal for the vacuum pump system may trigger an uncontrolled response in the vacuum pump system that the terminal controls.

- Every time a vacuum pump system is used with a hand terminal, it is essential to ensure a correct match between the two components. Use the paging function for this purpose (see Actuating the vacuum pump system, page 29).
- Additionally it is possible to use color stickers to indicate which hand terminal belongs to which vacuum pump system (see chapter 11. Ordering information).

WARNING
Uncontrolled operation may result in personal injury and damage to the vacuum pump system.

If the wireless connection between the hand terminal and vacuum pump system is broken, the vacuum pump system will continue to operate with the current settings.

- Immediately determine and remove the cause of the interruption between the hand terminal and vacuum pump system (chapter 10, page 40).
- If you are not able to reestablish wireless contact, replace the hand terminal back to the vacuum pump system (chapter 8.1.1, page 23). The vacuum pump system can also be operated directly and the ventilation valve and coolant valve can be opened and closed directly (chapter 8.2, page 32).

WARNING
Personal injury caused by poisoning or explosion and damage to the vacuum pump system.

- Make sure that no reactive or explosive mixtures will be produced when ventilating the vacuum pump system through the air inlet.
WARNING

Hazard of the vacuum pump system bursting due to excessive pressure increase

➔ Do not exceed max. permissible operating pressure (0 bar).
➔ Monitor pressure during operation.
➔ If the pressure exceeds the maximum permissible operating pressure, immediately shut down vacuum pump system and eliminate fault (see chapter 10, page 40).

WARNING

Personal injury caused by poisoning or explosion and damage to the pump.

➔ Make sure that no reactive or explosive mixtures will be produced when ventilating the vacuum system through the air inlet.
➔ Make sure that the media are compatible with each other (when running two different processes simultaneously).

CAUTION

Danger of high performance condenser bursting.
The high-performance condenser is not pressure-proof.

➔ Make sure that the high performance condenser’s gas outlet is not blocked.

In order for the high-performance condenser to recover solvent from the delivered gas, it must be cooled by means of a cold water supply or recirculating cooler.

When using a coolant valve:

WARNING

Danger of the high performance condenser bursting

➔ Make sure that the coolant valve is mounted between the coolant supply and the coolant inlet port of high performance condenser.

Pump standstill

With the pump at a standstill, open pressure and suction lines to normal atmospheric pressure

Inspect and empty collection flasks

At appropriate intervals, inspect the fill level in the condensation collection flasks located on the suction and pressure sides of the vacuum pump system (Fig. 2/12 and 15, page 11). When needed, empty the collection flasks; properly dispose contents.

Switching vacuum pump system on

The vacuum pump system may not start up against overpressure during switch-on. During operation as well, there may be no overpressure in the pneumatic lines. If a pump starts against pressure, it may block. This activates the thermal switch, and the pump switches off.
7.2. Taking system out of operation

⇒ Stop the ongoing process.
⇒ When transferring aggressive media, flush the vacuum pump system prior to switch-off to increase the service life of the diaphragms (see chapter 9.2.1, page 33).
⇒ Switch off vacuum pump system with mains switch (see fig. Fig. 2/13, page 11).
⇒ Switch off hand terminal at its I/O switch (see Fig. 4/3, page 15).

WARNING

Uncontrolled operation may result in personal injury and damage to the vacuum pump system.

If the hand terminal is switched off while the vacuum pump system remains switched on, the vacuum pump system will continue to operate with the current settings.

⇒ Always switch the vacuum pump system off when done working.
8. Operating vacuum pump system

8.1. Hand terminal

8.1.1. General functions and displays

The vacuum pump system is operated via the hand terminal with the aid of:

- a rotary/push knob
- a touchscreen.

The **rotary/push knob** has the following functions:

- Rotate: Changes pump capacity or the selected pressure setting (depending on selected operating mode).
- Press: Interrupts the active process and switches into manual process control (pressing effects an evacuation in this case).

**Touchscreen** contents:

- Display of the most important process variables (Fig. 8, page 25).
- Menu for selecting operating mode and units for pressure display (Fig. 9, page 25).
- Operating buttons (Fig. 9, page 25) with the following functions:
  - Start and stop the process;
  - open and close the ventilation valve;
  - open and close the high-performance condenser’s coolant valve (accessory).

---

1. Upper grip
2. Touchscreen
3. I/O switch
4. DC input 24 V
5. Rotary/push knob for
   - adjusting pump speed and setpoint pressure
   - switching to manual operation

---

Fig. 7: Hand terminal

---
To remove the hand terminal from the vacuum pump system: grasp the upper grip of the hand terminal (Fig. 7/1) and pull until it releases, and then remove it.

Replacing the hand terminal:
Insert the bottom of the terminal into the holder provided in the vacuum pump system (Fig. 2/14, page 11); then push firmly on the upper grip of the terminal (Fig. 7/1) until it clicks into place.

Whenever the hand terminal is located in the holder while the vacuum pump system is turned on, the batteries in the hand terminal will charge automatically. This happens irrespective of whether the hand terminal is switched on or off.

Every time you use a hand terminal, check to ensure a correct match between the terminal and the vacuum pump system. Use the paging system for this purpose (see Actuating the vacuum pump system, page 29).

Displays
1 Battery:
   - Charging
   - Charging status

2 Connection to vacuum pump system
   - Direct connection
   - Wireless connection

3 Process time
4 Actual pressure in selected pressure unit (or "No connection", if no wireless connection to vacuum pump system)
5 Process active
6 Capacity in percent or setpoint pressure in selected pressure unit (depending on operating mode)
7 Explanation of rotary/push knob functions
   (Rotate: change capacity; Press: interrupt operating mode and switch to manual process control)
8 Only in Automatic operating mode
   Automatic with pressure reduction
9 Only in Automatic operating mode
   Automatic pressure reduction active

Fig. 8: Display on the touchscreen
Menus and buttons
1 Operating mode menu
2 Pressure units menu
3 Button Actuating the vacuum pump system (Paging)
4 Button for ventilation valve:
   ON = To open
   CLOSE = To close
5 Button for coolant valve
   (accessory) at high-performance condenser:
   ON = To open
   CLOSE = To close
6 Button for the process:
   START = To start
   STOP = To stop
7 Button for automatic pressure reduction:
   Press = Finish (the current pressure is applied as the setpoint pressure)

8.1.2. Operation

Menu language
When the start page appears after switching the hand terminal on, choose between the following languages: German, English, French, Italian, Spanish, Dutch, Japanese, and Chinese. The selection can be made only immediately after switching on.

Pressure unit
Process pressure can be displayed on the hand terminal in mbar, bar, hPa, or Torr.
Use the Pressure units menu to select the pressure units (button on touchscreen; see Fig. 10).

Pressure units can be changed only when no process is active.
In order to change the unit of pressure, it is necessary to temporarily switch to another operating mode.
Operating modes

The current operating mode is displayed at the top of the hand terminal's touchscreen. Press on this line of the touchscreen to open the menu for changing operating mode (see Fig. 11, at the top).

⚠️ Operating mode can be changed only when no process is active.

Switching to manual process control (Break)

- Press briefly on the rotary/push knob:
  Manual process control; actual pressure will be adopted as the setpoint pressure and actively controlled.

Within the manual process control

- Press on the rotary/push knob:
  Vacuum pump system will evacuate.

- Let go:
  Actual pressure will be adopted as setpoint pressure.

- Rotate:
  Changes setpoint pressure.

Fig. 11: Operating mode menu
Starting and stopping the process
Pressing the START button starts a process.
Pressing the STOP button stops a process.

Open and close the ventilation valve

<table>
<thead>
<tr>
<th>WARNING</th>
<th>Personal injury caused by poisoning or explosion and damage to the vacuum pump system</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Ensure that the creation of reactive, explosive or otherwise hazardous mixtures during the supply of air is prevented.</td>
</tr>
</tbody>
</table>

Pressing the ON button for ventilation valve (left button below) opens the ventilation valve.

- If the ON button is pressed for more than 3 seconds, the ventilation valve remains open.

If the ventilation valve is permanently open (OFF button shown in display), it can be closed again with the OFF button.

Opening and closing coolant valve (accessory)
Pressing the ON button for coolant valve (right button below) opens the coolant valve on the high-performance condenser.
Pressing the OFF button for the coolant valve closes the coolant valve on the high-performance condenser.

Entering value in Evacuate operating mode
Use the rotary/push knob to set pump capacity.

Entering value in Pressure control operating mode
Use rotary/push knob to set desired pressure.

Entering value in Automatic operating mode
Not necessary to enter value.
If a boiling point is detected in Automatic mode, after the system regulates to this pressure, the pressure is reduced automatically to speed up evaporation of the solvent (see Fig. 12).
1.) Start Automatic operating mode

2.) Boiling point detected; system regulates to this pressure

3.) Automatic pressure reduction

---

**Fig. 12: Automatic function sequence**

- If you press the arrow key (see Fig. 9/7) during automatic pressure reduction, the current pressure is applied as the new setpoint pressure and the vacuum pump system regulates to this pressure. The current setpoint pressure is shown in the display in place of the arrow.

- If you press again on the setpoint pressure value, automatic pressure reduction is reactivated and the arrow appears in the display after about 25 seconds.

---

**Entering value in Function operating mode**

The desired pressure curve is entered via data points that connect the vacuum pump system to pressure ramps.

---

**Fig. 13: Menu for Function operating mode**

Entering data points (up to 12):

1. Time interval since the last data point: \( \Delta t \)
2. Setpoint pressure: p (mbar) / p (bar) / p (hPa) / p (Torr)

3. Additional options ("+" column) to influence the course of the function:
   - CV1: Open coolant valve (accessory):
   - CV0: Close coolant valve (accessory):
   - S: Jump – the system evacuates/ventilates to the required pressure as quickly as possible.
   - A: Automatic – Automatic detection of the boiling pressure
     If the set limit pressure is reached without a vapor pressure, the program goes to the next function step.
   - A+: Automatic Plus – Automatic detection of the vapor pressure with subsequent pressure reduction.

Line selection (see Fig. 13):
   - To change the line:
     Turn the rotary/push knob.
   - To select a line for editing:
     Press the rotary/push knob.

To edit a selected line:
   - To change columns:
     (e.g. from ∆ t to p (mbar):
     Press the rotary/push knob.
   - To change an entry:
     Turn the rotary/push knob.

After the last column (+), the display automatically returns to line selection and jumps to the next line.

If you are in input mode and have not entered any data within 3 seconds, the display automatically returns to line selection.

The function values of the data point table are stored in the internal memory of the vacuum pump system when the process starts, and are available again when there is a restart.

Changes to the function values (sampling point table) are carried over directly from the PC software, which may be used simultaneously.

Repeating/deleting sampling points:
The following symbols may be set in the column for the time intervals under the value 00:00:00:
   -  = Repetition. The desired number of repetitions can now be specified in the field for the setpoint pressure.
   - ... = Deletion of the data point.

In both cases, all subsequent sampling points are automatically deleted.
Calling the stored data point tables:

- Press the button to select data point tables (arrow in Fig. 13) and select the required data point table.
  You can now see the data point table that is stored under the number.

> Up to 10 different data point tables can be stored and called as required. The number in the display (arrow in Fig. 13) indicates the data point table that is currently selected.

**Actuating the vacuum pump system (Paging)**

When you press the circle symbol for the active process (Fig. 8/5, page 25) in the hand terminal display, the LED next to the page button (Fig. 15, page 32) on the vacuum pump system will blink.

The other way around, the hand terminal will answer with a signal tone if you press the paging button of the vacuum pump system (see chapter 8.2, page 32).

**No wireless connection**

If there is no wireless connection between the hand terminal and the related vacuum pump system (for example if the vacuum pump system is not switched on or the wireless connection is being established or is interrupted):

- The message "No connection" will blink in the hand terminal's display (see figure 14);
- An audible warning will be emitted if a button on the touchscreen is pressed.

Refer to chapter 10, table 9 for tips on resolving this problem.

---

![Display „No connection“](image-url)
8.1.3. Changing batteries on the hand terminal

**CAUTION**

ESD-sensitive devices (ESDS)

The nonobservance of the ESD-protection specifications under the IEC 61340-5-1 can lead to a partly or total defect of the hand terminal.

⇒ Only handle the hand terminal at an ESD-protected area (EPA) by a qualified person under the IEC 61340-5-1 directive.

1. Loosen the four screws on the underside of the hand terminal.
2. Remove the rear cover plate.
3. Replace the batteries.
4. Re-install cover plate.
5. Dispose of batteries according to regulations.
8.2. Operation without hand terminal

The following actions can be taken directly on the vacuum pump system when the hand terminal is removed (Fig. 15):

- Stop the process;
- Open and close the ventilation valve;
- Open and close the high-performance condenser's coolant valve (accessory);
- Call the hand terminal (paging); the hand terminal will answer with a signal tone.

Fig. 15: Buttons on vacuum pump system

8.3. Software

Please see the delivered CD for information on operating the vacuum pump system via software.
9. Servicing

9.1. Servicing Schedule

<table>

<td>Vacuum pump system</td>
<td>Regular inspection for external damage or leaks</td>
</tr>
<tr>
<td>Diaphragms and valve plates</td>
<td>Replace at the latest, when pump output decreases</td>
</tr>
</tbody>
</table>

Tab. 5

9.2. Cleaning

When cleaning, make sure that no liquids enter the inside of the housing.

9.2.1. Flushing Vacuum pump system

![WARNING]

Personal injury caused by poisoning or explosion and damage to the vacuum system

When flushing the vacuum pump system with inert gas, make sure that the gas ballast valve is closed so no reactive or explosive mixtures can form.

Before switching off the vacuum pump system, separate it from the vacuum chamber and flush it with air (if necessary for safety reasons: with an inert gas) under atmospheric conditions (ambient pressure) for about five minutes.

If inert gas is used: connect the inert gas feed to the gas inlet (Fig. 2/7, page 11) of the vacuum pump system. Observe the safety instructions in chapter 3.

9.2.2. Cleaning Vacuum pump system

Only clean vacuum pump system with a damp cloth and non-flammable cleaning agents.

9.2.3. Emptying collection flask on the suction and pressure sides

Suction side

1. Grasp the collection flask (Fig. 2/12, page 11) and simultaneously remove attachment clamp 11; pull out collection flask.
2. Dispose of contents in collection flask according to local regulations. Then rinse out collection flask.
3. Reattach collection flask.
Pressure side

1. Grasp the collection flask (Fig. 2/15, page 11) and simultaneously remove attachment clamp 16; pull out collection flask.

2. Dispose of contents in collection flask according to local regulations. Then rinse out collection flask.

3. Reattach collection flask.
9.3. Changing Diaphragms and Valve Plates

Conditions
- Vacuum pump system is switched off and mains plug is removed from the socket
- Vacuum pump system is clean and free of hazardous materials

Tab. 6

Information on procedure

- Always replace diaphragms and valve plates together to maintain the pump performance.

WARNING

Health hazard due to dangerous substances in the vacuum pump system and pump! Depending on the substance transferred, caustic burns or poisoning are possible.

- Wear protective clothing if necessary, e.g. protective gloves.
- Flush vacuum pump system before replacing the diaphragms and valve plates (see chapter 9.2.1, page 33).

CAUTION

Danger of burns from hot pump parts

The pump head or motor may be hot even after the pump has been shut off.

- Allow the pump to cool off after operation.

Remove pump head

1. Remove tubing from the inlet and outlet connectors of the pump.
2. Undo the two screws (Fig. 16/1) and nine screws (2) of the head cover (3).
3. Undo two screws (6) each, and remove both covers (5) at head cover (4).
4. Lift the head cover (3) off the pump housing (17).
5. Lift off head plate (9) with intermediate plates (10), (13) and (14).
Servicing  Vacuum Pump System SC 920G

Change diaphragms

1. Turn the diaphragms (15) (2 pieces) and (22) (1 piece) outwards with your hands, counterclockwise. For this, turn the fan (19) such that you can easily grip each diaphragm with your hands.

   For diaphragms (15):
   Make sure the diaphragm spacers being between diaphragm and connecting rod (21) do not fall into the pump housing.
   If diaphragm spacers should adhere to the diaphragms, take them off and put them on the thread of the corresponding connecting rod.
   In order to ensure the pneumatic output of the pump, it is essential that the diaphragm washers are subsequently remounted in the same quantity in each case.

2. Screw the new diaphragms (15) (2 pieces) and (22) (1 piece) onto the connecting rods (20) and (21) and tighten it by hand.

   Before you finally tighten the diaphragm, you are recommended to move the diaphragm to the upper dead center by rotating the fan (19).

3. Put head plate (9) with intermediate plates (10), (13) and (14) on adapter (16).
Change valve plates
1. Mark the position of head plate (9) and intermediate plate (10) relative to each other by a drawing line with a felt-tip pen. This helps avoid incorrect assembly later.
2. Mark the position of head plate (9) and intermediate plate (13) relative to each other by two drawing lines with a felt-tip pen.
3. Mark the position of head plate (9) and intermediate plate (14) relative to each other by three drawing lines with a felt-tip pen.
4. Undo the three screws (6) in head plate (9) and remove head plate from intermediate plates (10), (13) and (14).
5. Remove valve plates (12) and O-rings (11) from intermediate plates (10), (13) and (14).
   Instead of lying on intermediate plate, O-rings could stick to head plate (9).
6. Lay the new valve plates (12) and the new O-rings (11) on the intermediate plates (10), (13) and (14).
   Upper and lower sides of the valve plates are identical. For correct position see fig. 17.
7. Dispose of the old diaphragms and valve plates/sealings properly.

Mount pump head
1. Place head plate (9) on intermediate plates (10), (13) and (14) in the position indicated by the drawing lines.
   At the front edge the three intermediate plates must lie in a line on which head plate is placed flushly.
2. Tighten the three screws (6) of head plate (9) carefully slightly hand-tight (tightening torque: 0.6 Nm).
   For position and orientation of disk spring (7) and washer (8) of screw (6) see fig. 18.
3. Place head cover (3) on pump housing (17).
4. Tighten the nine screws (2) of head cover (3) slightly in the first instance. Start with the screws of medium pump stage, then tighten the screws on the right, and finally on the left.
5. Now, tighten the screws (2) firmly (tightening torque: 6 Nm); tighten the center screws first, then continue outward.
   If the screws are stiff to turn, the intermediate plates do not lie in a line at front edge, or intermediate plates and head plate are not placed flushly (see step 1).
6. Remount the covers (4).
7. Tighten the two screws (1) on the head cover (tightening torque: 5 Nm).
Final steps
1. Reconnect vacuum pump system tubing.
2. Reconnect vacuum pump system to the electricity supply.
9.4. Replace overpressure valve on high performance condenser

**Conditions**
- Vacuum pump system is switched off and mains plug is removed from the socket
- Vacuum pump system is clean and free of hazardous materials

**Information on procedure**

**WARNING**

Health hazard due to dangerous substances in the vacuum pump system and pump!

Depending on the substance transferred, caustic burns or poisoning are possible.

⇒ Wear protective clothing if necessary, e.g. protective gloves.

⇒ Flush vacuum pump system before replacing overpressure valve (see chapter 9.2.1, page 33).

1. Unscrew and remove hose nozzle which connects the high performance condenser with the pressure side of the pump from high performance condenser.
2. Detach the old overpressure valve from screw socket of high performance condenser.
3. Slide on the new overpressure valve. Be aware that the overpressure port is completely covered.
4. Reconnect high performance condenser with pump.
10. Troubleshooting

Extreme danger from electrical shock!
 Disconnect the pump power supply before working on the pump.

DANGER ➔ Make sure the pump is de-energized and secure.

- Vacuum pump system as a whole: see table 7.
- Hand terminal: see table 8.
- Software operation: see table 9.

## Fault cannot be rectified

If you are unable to determine any of the specified causes, send the vacuum pump system to KNF Customer Service (see last page for the address).

1. Flush the vacuum pump system to free the pump head, tubing and glas vessels of dangerous or aggressive gases (see chapter 9.2.1, page 33).
2. Clean the vacuum pump system (see chapter 9.2.2, page 33).
3. Send the vacuum pump system, together with completed Health and Safety Clearance and Decontamination Form (Chapter 13), to KNF stating the nature of the transferred medium.

*For situations in which several SC 920G vacuum pump systems are operated within the wireless connection range.*
12. Returns

Pumps and systems used in laboratories and process-based industries are exposed to a wide variety of conditions. This means that the components contacting pumped media could become contaminated by toxic, radioactive, or otherwise hazardous substances.

For this reason, customers who send any pumps or systems back to KNF must submit a Health and safety clearance and decontamination form in order to avoid a hazardous situation for KNF employees. This Health and safety clearance and decontamination form provides the following information, among other things:

- physiological safety
- whether medium-contacting parts have been cleaned
- whether the equipment has been decontaminated
- media that have been pumped or used

To ensure worker safety, work may not be started on pumps or systems without a signed Health and safety clearance and decontamination form.

For optimal processing of a return, a copy of this declaration should be sent in advance via e-mail, regular mail, or fax to KNF Customer Service (refer to final page for address). In order to avoid endangering employees who open the shipment's packaging, despite any residual hazards, the original version of the Health and safety clearance and decontamination form must accompany the delivery receipt on the outside of the packing.

The template for the Health and safety clearance and decontamination form is included with these Operating Instructions and may also be downloaded from the KNF website.

The customer must specify the device type(s) and serial number(s) in the Health and safety clearance and decontamination form in order to provide for the unambiguous assignment of the Declaration to the device that is sent to KNF.

In addition to the customer's declaration of physiological safety, information about operating conditions and the customer's application are also of importance to ensure that the return shipment is handled appropriately. Therefore, the Health and safety clearance and decontamination form requests this information as well.
Health and safety clearance and decontamination form

This declaration must be present and complete (the original must accompany the shipment's delivery receipt) before the returned device can be examined.

Device type:  
Serial number(s):  

Reason for returning the device (please describe in detail):  
(The device(s) was(were) in operation □ yes □ no)  

We confirm that the above device(s)  
□ has(have) pumped exclusively physiologically unobjectionable media and that it(they) are free of hazardous materials and any materials that are harmful to health.  
Pumped media:  
The device(s) was(were) cleaned □ yes □ no  
□ has(have) pumped media of the following category(categories) which are not physiologically unobjectionable and that cleaning of the device(s) (potentially only media-contacting parts) is required:  
□ aggressive  
□ biological  
□ radioactive  
□ toxic  
□ other  
The device(s) was(were) decontaminated and work can proceed without special measures □ yes  
Method / proof:  
The device(s) was(were) not decontaminated and special measures are required before starting work □ yes  
Measures:  

Legally binding declaration  
We herewith affirm that the information provided in this form is correct and complete. Shipment of the devices and components is in compliance with statutory regulations.
